

## BUSINESS PROPOSAL

# Proposal for an E-Voucher Workflow Approval System

Tailored for CMBank and designed to strengthen internal control, accelerate approvals, improve end-to-end voucher visibility, and automate callover review.

This proposal presents a secure digital workflow platform for initiating, reviewing, approving, posting, settling, and automatically performing callover after upload of the bank's XLS callover file.

**PREPARED FOR**

CMBank

**PREPARED BY**

TSoft Computers Inc.

**DATE**

June 8, 2026

**PROJECT TYPE**

Internal Workflow Automation

## **Executive Summary**

In banking and structured corporate environments, voucher processing must be timely, traceable, and tightly governed. Manual approval chains, fragmented email trails, incomplete financial records, and labor-intensive callover routines often create delays, reduce visibility, and increase compliance risk. This proposal recommends the implementation of a centralized E-Voucher Workflow Approval System for CMBank to digitize voucher processing from initiation to final settlement while also supporting automatic callover after upload of the bank's XLS callover file.

The proposed solution will support controlled approval routing across key functions such as Initiator, Operations, Finance Control, Internal Audit, Executive Approval, Posting, and Settlement. It also introduces automated callover handling to improve reconciliation speed and reduce manual review workload. Just as importantly, it creates a searchable digital record so vouchers, callover files, and supporting documents can be tracked and accessed quickly even after several years, instead of spending hours, days, or longer searching through physical files and paper archives. The result is a more efficient and transparent process that strengthens internal control and provides management with better oversight of operational and finance-related workflows.

## Business Context

### CURRENT CHALLENGES

- Manual or semi-manual voucher approvals that create delays across departments.
- Limited visibility into voucher status, approver actions, and pending bottlenecks.
- Difficulty maintaining complete records for audit, compliance, and financial review.
- Weak coordination between Operations, Finance Control, Internal Audit, and executive approvers.
- The current callover process is rigorous, bulky, difficult, and expensive because it depends heavily on printed paper, physical vouchers, and slow manual review.
- Searching for old documents, callover records, and vouchers can take hours, days, or even longer when records are stored manually.

### STRATEGIC NEED

- Digitize internal voucher processing without weakening governance controls.
- Standardize approvals across units, departments, or branches.
- Improve accountability with role-based ownership at every stage.
- Support internal audit readiness and stronger financial documentation.
- Automate callover handling from structured XLS uploads to improve speed and accuracy.
- Enable quick and reliable access to vouchers, callover records, and supporting documents across several years.

## Proposed Solution

TSoft Computers Inc. proposes a secure web-based E-Voucher Workflow Approval System that enables authorized staff to create vouchers, attach supporting documents, route requests through approval stages, capture accounting details, and track status through to posting and settlement.

In addition, the system includes an automatic callover feature that performs callover processing after the upload of the bank's XLS callover file. This makes the platform especially suited to CMBank because it combines workflow efficiency with the control discipline expected in a regulated financial institution.

The solution will be deployed on secure hosting infrastructure and will use a secure PostgreSQL database for structured financial records together with a secure Backblaze B2 S3-compatible bucket for voucher attachments, supporting documents, and uploaded callover files.

### CONTROL

#### Role-Based

Each participant operates within clearly defined authority and workflow limits.

### VISIBILITY

#### Real-Time

Teams and management can monitor voucher status and pending actions easily.

### ACCESS

#### Searchable

Vouchers, callover files, and attached records stay easy to retrieve even years later.

## Workflow Structure

The approval workflow can be aligned with CMBank's internal policy and escalation structure. A typical flow is shown below:

The same E-Voucher platform manages the full approval chain while keeping voucher raising, GL vetting, control checks, audit review, and final approval together in one controlled and fully auditable workflow.

1

### Initiator

The initiator starts the request and provides the purpose of the expense with the relevant details and support.

2

### Operations Raises Voucher

Operations formally raises the voucher in the system and confirms the request is complete and properly documented.

3

### Finance Vets GL & Controls

Finance vets the GL raised, validates the accounting treatment, and performs the required financial control checks.

4

### Audit Review

Audit checks the control position, reviews the GL treatment, and confirms the expense is reasonable and justifiable.

5

### COO Final Approval

The COO gives the final approval after the operational, finance, and audit checks have been satisfactorily completed.

This flow reflects the core approval sequence: **Initiator** -> **Operations** -> **Finance** -> **Audit** -> **COO**. Each step is recorded in the system with timestamps, user actions, comments, and supporting evidence.

**1****Initiation**

The request is initiated with amount, purpose, recipient, and supporting notes.

**2****Operations Raise Voucher**

Operations raises the voucher and confirms completeness before finance review.

**3****Finance Vetting**

Finance vets the GL raised and performs control checks.

**4****Audit Review**

Audit reviews control, GL treatment, and reasonability of the expense.

**5****COO Approval**

The COO grants final approval after all required checks are complete.

**6****Posting**

Posting reference is captured after processing.

**7****Settlement**

Cash advance or payment settlement is confirmed.

**8****Callover & Completion**

Uploaded XLS callover data is processed automatically and the voucher history is finalized.

The system also maintains clear states for every voucher so pending items, exceptions, and completed records are easy to monitor.

**RAISED** The request has been initiated and the voucher has been raised by Operations.

**OPERATIONS RAISED** Operations has completed voucher raising and routed it for finance review.

**VETTED** Finance has vetted the GL raised and completed control checks.

**AUDIT CHECKED** Audit has reviewed the controls, GL, and reasonability of the expense.

**APPROVED** The COO has granted final approval for posting and settlement.

**POSTED** Posting reference and accounting treatment have been captured.

**SETTLED** Payment or retirement of the cash advance has been confirmed.

**CALLOVER MATCHED** The uploaded callover file has been read and matched to the voucher record.

**CLOSED** Workflow is complete with a full audit trail retained in the system.

## Callover Flow

The system supports a structured callover process that starts with the CBA-provided Excel file and ends with matched and reviewable records inside the E-Voucher platform.

- Transaction references, amounts, dates, narration, and related identifiers.
- Mapped voucher numbers or other configured matching keys.

- Automatic comparison between uploaded callover data and voucher records.
- Visibility into matched items, pending items, and exceptions requiring review.
- A permanent audit log showing when the file was uploaded, read, checked, and concluded.

## Key Features

- Secure login and controlled user access.
- Role-based permissions for initiators, reviewers, approvers, and administrators.
- Voucher creation for direct expenses and cash advances.
- Recipient and observer assignment.
- Attachment support for supporting documents and evidence.
- Automatic callover processing after upload of the bank's XLS callover file.
- Quick search and retrieval of vouchers, callover records, and documents over several years.
- Workflow tracker showing current stage and progress.
- Approval, send-back, and exception handling actions.
- GL code and finance data capture.
- Posting reference number entry and settlement confirmation.
- Dashboard views for pending, approved, completed, and callover-related records, all visible at a glance.
- Full timeline log for each voucher action.

Benefits to CMBank

| AREA                   | EXPECTED BENEFIT                                                                                                                    |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Operational Efficiency | Faster voucher movement, reduced manual follow-up, and shorter approval turnaround time.                                            |
| Internal Control       | Stronger governance with role-based checkpoints, approval accountability, and controlled routing.                                   |
| Audit & Compliance     | Clear historical records of who initiated, reviewed, approved, returned, posted, settled, and verified each voucher.                |
| Management Visibility  | Improved oversight into pending queues, stalled items, completed workflows, and departmental performance, all visible at a glance.  |
| Callover Automation    | Uploaded XLS callover files can be processed automatically, reducing manual reconciliation effort and improving speed and accuracy. |
| Long-Term Retrieval    | Vouchers, callover records, and supporting documents remain easy to track, search, and access even after several years.             |
| Paper Reduction        | Drastically reduces paperwork, printing costs, and the stress associated with bulky manual filing and paper-based approvals.        |

## Scope of Work

- Requirements confirmation and workflow alignment with CMBank's approval structure.
- Design and implementation of the E-Voucher user interface.
- Setup of secure authentication and user role structure.
- Development of voucher creation, approval routing, posting, and settlement modules.
- Implementation of automatic callover processing based on uploaded XLS bank callover files.
- Dashboard and tracking views for operational visibility.
- Attachment support and activity logging.
- Testing, deployment support, and basic handover documentation.

## Implementation Timeline

| PHASE   | ACTIVITY                                                       | ESTIMATED DURATION |
|---------|----------------------------------------------------------------|--------------------|
| Phase 1 | Requirements review and workflow mapping                       | 1 week             |
| Phase 2 | Interface design and solution setup                            | 1 week             |
| Phase 3 | Core system development and configuration                      | 2 to 3 weeks       |
| Phase 4 | Callover automation setup and validation with sample XLS files | 1 week             |
| Phase 5 | Testing, review, refinements, deployment, and handover         | 1 to 2 weeks       |

## Commercial Terms

The pricing below covers delivery and infrastructure support for the first year.

| OPTION            | DESCRIPTION                                                                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fixed Project Fee | NGN 5,000,000 (Five Million Naira Only)                                                                                                              |
| Coverage          | This covers design, development, deployment, hosting, secure PostgreSQL database, and secure Backblaze B2 S3-compatible bucket storage for one year. |
| Payment Structure | 40% upfront, 30% after development and testing, and final 30% upon deployment, training, and finalization.                                           |

## Assumptions and Exclusions

- CMBank will confirm final approval roles, workflow rules, and exception scenarios.
- Hosting, domain, and third-party service fees may be handled separately unless expressly included.
- Email alerts, SMS notifications, advanced reporting, ERP integration, and expanded callover templates can be delivered as an additional phase where required.
- Sample and live XLS callover formats will be provided by CMBank for configuration and validation.
- Final branding, legal text, and approval policy wording will be aligned before go-live.

This proposal is intentionally structured for regulated and control-sensitive organizations where workflow accountability, audit readiness, operational discipline, and reconciliation accuracy are essential.

## Conclusion

The proposed E-Voucher Workflow Approval System will help CMBank modernize its internal financial workflow by replacing fragmented manual processes with a secure, traceable, and professionally structured digital solution. The platform is designed to strengthen control, improve processing efficiency, provide leadership with better operational visibility, automate callover handling from uploaded XLS files, and ensure that vouchers and related records remain quick to retrieve even years after creation.

TSoft Computers Inc. would welcome the opportunity to discuss this proposal further and align the final implementation with CMBank's internal process, approval hierarchy, compliance expectations, and callover requirements.
